 - 8. Test Data Used**
 - 9. Project Installation Instructions**
-

1. 🚀 Problem Definition:

- Students and staff often seek information on the following:
 - Upcoming events and their schedules
 - Information about past events
 - Types of different events
 - Images/media galleries of past events
 - Department -wise listing of events
 - However, as of today, there is often a lack of centralized communication and visibility of these events.
 - There is a necessity for a Web site to bridge this gap by providing a centralized portal where students and faculty can view information about upcoming, ongoing, and past events organized within the college and gain other related data about them .
-

2. 💡 Proposed Solution:

The solution is to develop a responsive Web site titled Campus Connect, which displays categorized information about events. The Web site will read event data from JSON files and display it through a clean, well -structured UI. It will support viewing department -wise events, category -wise filtering (Technical, cultural, or sports), event descriptions, schedules, organizers, and media gallery.

It will serve as a centralized hub for students and faculty to explore upcoming events and access related details.

- The target audience for this Web site includes:

Students: Looking for information on upcoming events, their interests, and registration details.

Faculty: Wishing to promote events organized by their departments or clubs.

- **Visitors:** Interested in college events open to the public.
-

3. Scope of the Project :

The Campus Connect portal will feature responsive user interface designed for

clarity and ease of use. It will dynamically read event details—including title,

description, date, department, type, image path, and organizer information—

from a JSON data source. Users will be able to filter and search for better accessibility

- The portal will consist of multiple pages such as Home, About, Gallery, Events, Feedback, and Contact

4. Functional Requirements :

The portal will consist of following core functional components:

- **Home Page:**

The Home Page acts as the primary landing page

The home page displays welcome message and banner :

A banner image or slideshow

- **Typical menu links include:**

[Home](#)

[About Us](#)

[Event Calendar](#)

[Event Details](#)

[Registration \(Static form/link\)](#)

[Gallery](#)

[Contact Us](#)

The home page displays highlights of upcoming events.

- **About Page:**

The About Page provides viewers with essential background information about the college, its traditions, the types of events it hosts, and the teams or bodies that organize these events. This page builds context and trust, especially for new students, guests, or potential sponsors.

- **Event Listing Section**

The system will display a structured list of upcoming and past events, where each event entry includes key details such as the event name, date, time, venue, and a short description. This information will be loaded dynamically from a local JSON file and rendered on the Web page using JavaScript. • Allow filtering and sporting events by category (for example, academic, cultural, or sports).

The system will provide filtering options that allow users to view events by specific categories such as: Academic Events? Cultural Events? Sports Events? Departmental Events

- **Gallery Page**

The system will display event-related images through a JSON data file, keeping the site

- Display images organized by year or category.

the Gallery page will allow users to view event images grouped by academic year or by category A filter mechanism (drop-down) will be implemented to rearrange the displayed content based on the selected grouping.

- **Feedback Page**

The Feedback page will include a feedback form that is designed purely for user interface demonstration purposes and will not perform any form submission or data processing.

The form will include the following input fields: Name: Email: User Type: Event Attended Rating: Comments

Displays contact details of faculty and student coordinators: The Contact page will present a list or card-style layout showing the names, designations, departments, phone numbers, and email addresses of faculty members and student coordinators involved in organizing campus events

- **Google Map embed:**

The Contact page shall include an embedded Google Map element showing the location of the college campus. The embed will use a location pin via Google Maps' sharing feature, helping users visually locate the venue for offline or physical events.

- **Bookmarking**

Bookmarking Images/text content can be favorited or bookmarked (temporarily for the session duration only).

5. NON FUNCTIONAL :

There are several non-functional requirements that should be fulfilled by the Website. Some of these include:

- Safe to use:
 - Accessibility:
 - User-friendliness:
 - Operability:
 - Performance:
 - Scalability:
 - Availability:
 - Compatibility:
-

6. 🎯 Design Specifications (UI) ✨:

Test Summary:

- Filters show events by category
- Sorting works by date/name/category
- Bookmark adds events to Favorites
- Feedback form validates inputs
- Gallery opens in lightbox with navigation

9. Project Installation Instructions:

1. Download the Project
 - a. Download the ZIP file from the provided Google Drive link.
 - b. Extract (unzip) the folder to your computer.
2. Open the Project
 - a. Open the extracted folder in *Visual Studio Code* (or any code editor).
3. Install Dependencies (first time only)
 - a. Open the integrated terminal in VS Code.
 - b. Run this command once to install required dependencies:
 - c. `npm install`
4. Run the Project Locally
 - a. To start the project, run:
 - b. `npm run dev`
 - c. A local link will appear in the terminal (e.g., `http://localhost:5173/`).
 - d. Press Ctrl + Click on the link to open the project in your browser.
5. Access the Website
 - a. The system will now run locally with full functionality.
